SUMMARY

Recent SUNY Albany Informatics graduate with hands-on experience in data pipeline development, requirements elicitation, SDLC documentation, and stakeholder communication. Skilled in Python, SQL, and Tableau; proven ability to translate business process needs into technical solutions and deliver analytical findings to both technical and non-technical audiences.

EDUCATION

SUNY University at Albany Albany, New York

B.S. in Informatics, Concentration: Software Development | Minor in Machine Learning May 2026

- GPA: 3.4
- Relevant Coursework: Data Structures & Algorithms, Objects & Design, Computer Organization & Programming, Machine Learning, Artificial Intelligence, Object-Oriented Programming, Statistics & Applications

EXPERIENCE

Global Tech HQ New York, NY

Experimental Learning: Data Wrangling January 2024 – May 2024

- Collaborated with cross-functional stakeholders to elicit business requirements, draft data definitions, and translate business process needs into technical solutions — applying core requirements elicitation practices across the full data workflow lifecycle
- Designed and validated SQL and Python data-processing pipelines to extract, clean, transform, and standardize large datasets from multiple sources, ensuring data accuracy and consistency for downstream analysis
- Documented as-is data workflows and contributed to to-be process improvements, supporting trend identification and root cause analysis across business intelligence operations
- Synthesized and reported analytical results in written documentation, improving data accessibility and supporting decision-making for technical and non-technical stakeholders

PROJECTS

Biotech Funding Analysis Dashboard Python (pandas), Tableau, Statistical Modeling

Data Analyst January 2026 – Present

- Extracted, aggregated, and performed quality checks on a 10,000+ record biotech funding dataset using Python (pandas), resolving missing values, capping outliers, and engineering categorical variables to support analytic use cases
- Designed a multi-visualization Tableau dashboard — choropleth maps, treemaps, dual-axis trend charts, and scatter plots — translating business process questions into data-driven stakeholder deliverables
- Identified key trends including the 2019 inflection point, 2021 COVID funding peak of $70B, and geographic concentration patterns; applied statistical correlation analysis ($R^2 = 0.92$) to quantify the relationship between company capital and deal size
- Presented findings in structured written reports, situating statistical results within broader market context for non-technical stakeholders

Gridiron: NFL Game Prediction Platform Python, LightGBM, scikit-learn, FastAPI, Next.js, Vercel

Lead Developer | gridiron-nfl.vercel.app 2024 – Present

- Built an end-to-end ML system that predicts the winner, final score, spread, and total for every NFL game before kickoff, combining logistic regression, ridge, and LightGBM models across ~90 features (Elo ratings, QB rating, injuries, weather, betting lines) engineered to prevent data leakage
- Backtested on 3,017 games from 2015 to 2025, training each season only on prior seasons; the model picked 66.3% of winners, matching the sportsbook closing line (66.1%), with well-calibrated probabilities
- Built a pipeline that processes 1.24M plays into Parquet files and serves them through FastAPI to a Next.js dashboard; a scheduled job refreshes, grades, and redeploys the site several times each game day, keeping the previous version live if any step fails
- Added a live win-probability model driven by each play, player-prop ranges from quantile models, and a 5,000-run season simulator for playoff odds; validated with 164 Python and 34 frontend tests, CI on every push, and a daily browser test at phone and desktop widths

Credit Card Fraud Detection & Interactive Dashboard Python, Statistical Modeling

Personal Project November 2024 – January 2025

- Designed and tested data-processing pipelines to extract, clean, and validate transaction data from multiple sources, performing systematic quality checks to ensure reliability and consistency
- Developed statistical models to identify anomalous transaction patterns, supporting root cause analysis of fraudulent activity and recommending improvements to detection logic
- Conducted iterative systems testing on detection processes, implementing improvements that increased model accuracy and maintainability
- Built an interactive dashboard to visualize flagged events and system outputs; authored written documentation supporting decision-making for technical and non-technical audiences

SKILLS

Programming & Query Languages: Python, SQL, JavaScript, HTML/CSS, Node.js, React.js, Java
Data & Analytics Tools: Tableau, Jupyter Notebooks, pandas, NumPy, scikit-learn, LightGBM, Plotly/Dash, Microsoft Excel
Data Competencies: Requirements elicitation, business process analysis, SDLC documentation, as-is/to-be workflow analysis, data validation & quality assurance, statistical modeling, dashboard development, root cause analysis, technical documentation
Dev Tools & Platforms: Git, AWS, Docker, FastAPI, Vercel, VS Code, PyCharm, IntelliJ, Hugging Face, macOS, Linux, Windows
Soft Skills: Stakeholder communication, cross-functional collaboration, written reporting, attention to detail, translating business needs into technical solutions
